Name: _____

Date: _____

Assignment:

Build a **dynamic dashboard builder** that allows users to add, edit, and arrange various UI components similar to building blocks in Canva, Figma, or HTML page editors. Please refer the screens for ideation.

Requirements:

1. **Core Features:**
    - Ability to **add, move, and resize sections** within the dashboard.
    - Add **elements** like:
        - Text Editor (rich text formatting – bold, italic, font-size)
        - Image upload and placement
        - Graphs (bar/line chart – dummy data acceptable). Include **at least 1 graph** generated dynamically.
    - Each element should be **draggable and resizable**.

2. **Data Storage:**
    - Save the layout configuration (position, size, and content of elements) in a **MySQL database**.
    - Fetch and render the saved layout on reload.

3. **Frontend:**
    - Use **JavaScript/HTML5 Canvas or libraries like Fabric.js/Chart.js** for interactive components.
    - Ensure **responsive design** (desktop-first is fine, but adaptable).

4. **Backend:**
    - Use **LAMP stack** (PHP + MySQL).
    - Provide **APIs** to save and retrieve dashboard layouts.

Deliverables:

- A working **prototype** of the dashboard builder (with dummy data).
- SQL schema and sample data.
- Short README with instructions to set up.
